Proposal: We will build a website where people can find almost all sorts of jobs from professional to chores. The people who want to hire job seekers will post jobs and the job seekers will be able to apply for the job and get hired. The jobs will have locations, description, documents and all

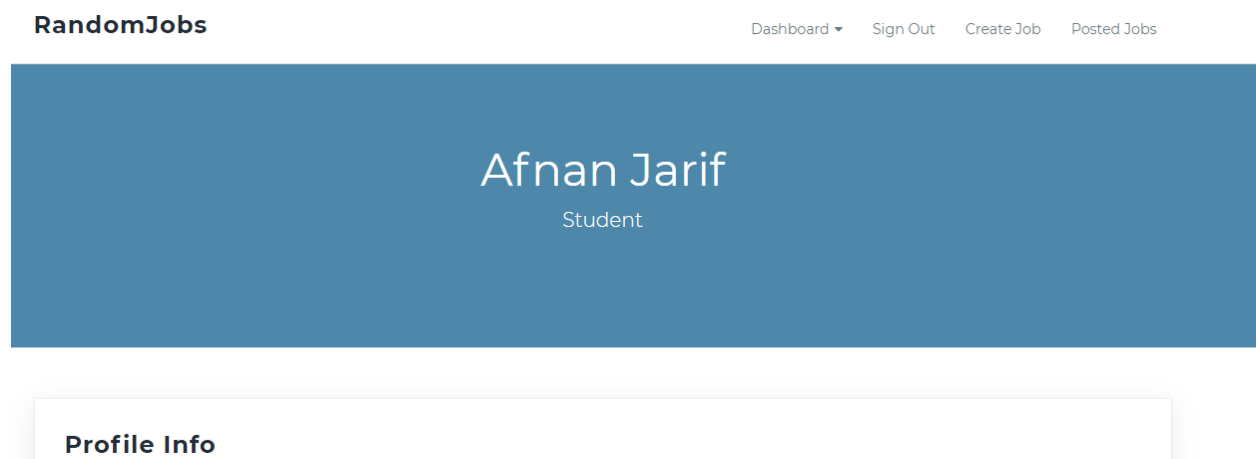

Users: There will be two types of user:

1. Job seeker
2. Recruiter

Recruiter: A recruiter can post or delete a job. He can hire a jobseeker, review and rate a job seeker.

Jobseeker: A job seeker can find a job according to their will. Rate and review the recruiter. He can search recruiter by his name and search job by its name from home page

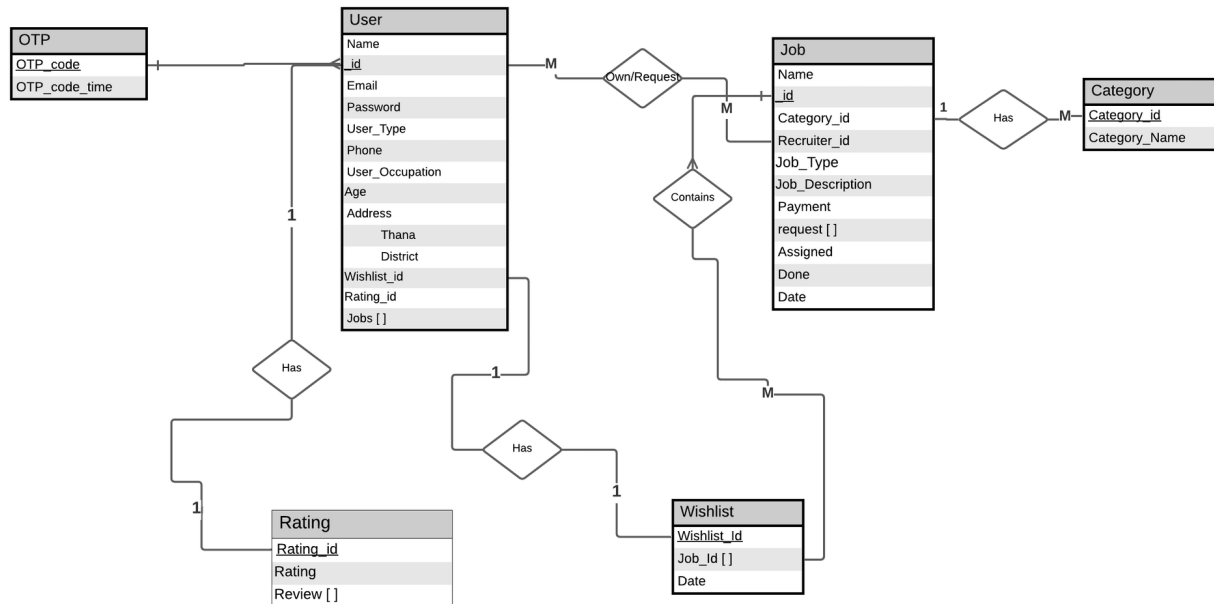

This website has two interfaces , when a visitor login as a recruiter(it can be decided when a user opens his account there is a field called “user Type”) there will be a dashboard(profile), create a job where he can create a job and post it, he can see the posted job he made.

He can update his profile(name,email, usertype, profile picture etc). He can signout from .

If a user login as a jobseeker he searches for a job and recruiter by his name . He can enroll in a job. After completing the job he can mark as done and rate the recruiter by his behavior or attitude. Job seekers can also update his profile.
